Clone and migrate apps

Clone an existing app to create a duplicate app on the same Kubernetes cluster or on another cluster. Cloning can help if you need to move applications and storage from one Kubernetes cluster to another. For example, you might want to move workloads through a CI/CD pipeline and across Kubernetes namespaces.

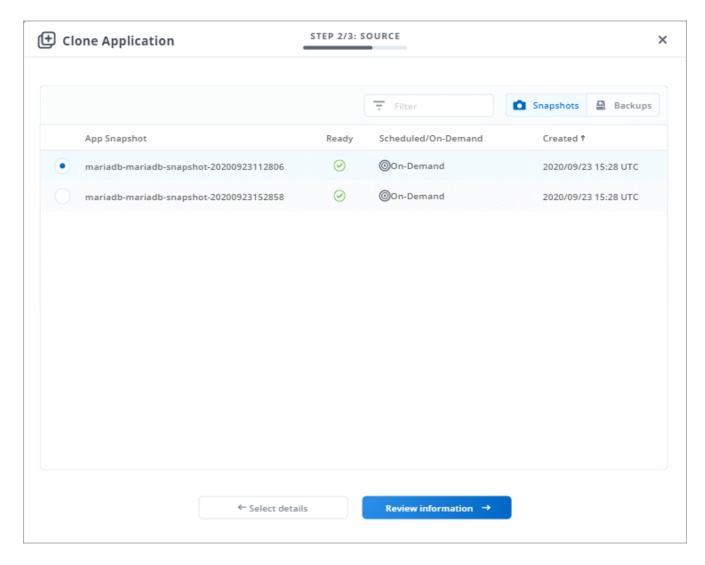

When Project Astra clones an app, it creates a clone of your application configuration and persistent storage.

Steps

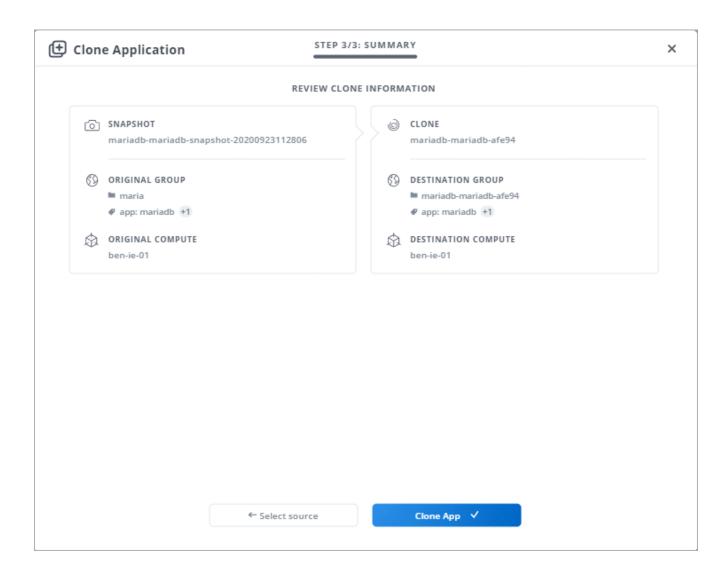

- 1. Click Apps.
- 2. Click the drop-down list in the **Action** column for the desired app.
- 3. Click Clone.

- 4. Clone details: Specify details for the clone:
 - Enter a name.
 - Choose a destination cluster for the clone.
 - Choose whether you want to create the clone from an existing snapshot or backup. If you don't select this option, Project Astra creates the clone from the app's current state.
- 5. **Source**: If you chose to clone from an existing snapshot or backup, choose the snapshot or backup that you'd like to use.

6. Clone Summary: Review the details about the clone and click Clone App.

Result

Project Astra clones that app based on the information that you provided.
